

Lending Club Case Study

SHRUTI CHOUDHARY

JEYASHREE M

Problem Statement

When the lending club company receives a loan application, the company has to make a decision for loan approval based on the applicant's profile. Two types of risks are associated with the bank's decision:

- If the applicant is not likely to repay the loan, i.e., he/she is likely to default, then approving the loan may lead to a financial loss for the company
- If the applicant is likely to repay the loan, then not approving the loan results in a loss of business to the company

The company wants to understand the driving factors (or driver variables) behind loan default, i.e., the variables which are strong indicators of default. The company can utilize this knowledge for its portfolio and risk assessment.

Business Objective

This company is the largest online loan marketplace, facilitating personal loans, business loans, and financing of medical procedures. Borrowers can easily access lower interest rate loans through a fast online interface.

Like most other lending companies, lending loans to 'risky' applicants is the largest source of financial loss (called credit loss). The credit loss is the amount of money lost by the lender when the borrower refuses to pay or runs away with the money owed. In other words, borrowers who **default** cause the largest amount of loss to the lenders. In this case, the customers labelled as 'charged-off' are the 'defaulters'.

If one is able to identify these risky loan applicants, then such loans can be reduced thereby cutting down the amount of credit loss. Identification of such applicant's using EDA is the aim of this case study.

Data Understanding

[Loan dataset](#)

Rows	Columns
39717	111

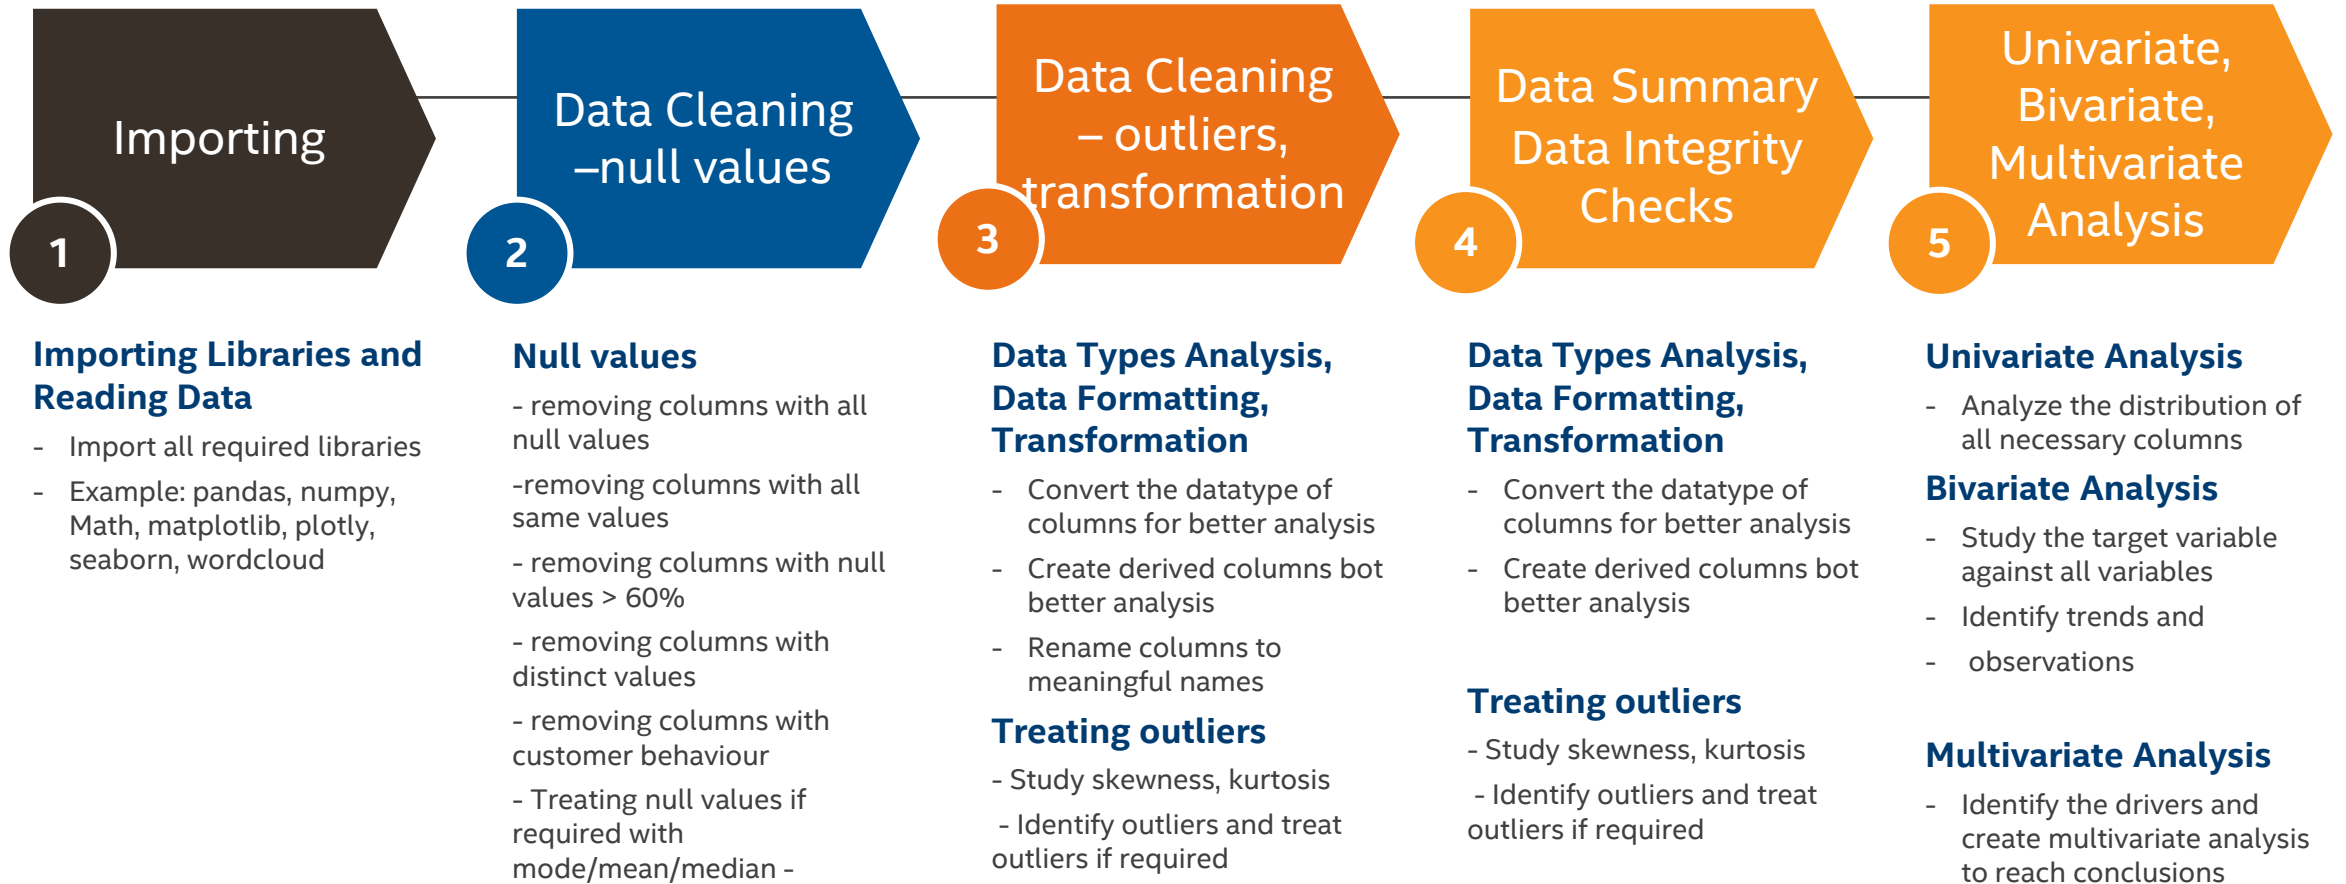

ADDITIONAL DETAILS ON DATA DICTIONARY

Data Dictionary

Data dictionary: A description and variable definition for all the columns is provided for analysis
https://github.com/ahmedishag/LENDING-CLUB-CASE-STUDY/blob/main/Data_Dictionary.xlsx

Column Name	Description
Loan_Amount	Amount requested by applicant
Funded Amount	The total amount committed to that loan at that point of time
Term	Loan duration term in months
int_rate	Interest Rate on the loan
installment	The monthly payment owed by the borrower if the loan originates.
grade	Lending club assigned grade
sub_grade	Lending club assigned sub-grade (within grade)
emp_title	The job title supplied by the Borrower when applying for the loan.
emp_length	Employment length in years. Possible values are between 0 and 10 where 0 means less than one year and 10 means ten or more years.
home_ownership	The home ownership status provided by the borrower during registration.
annual_inc	The self-reported annual income provided by the borrower during registration.
verification_status	Indicates if income was verified by Lending club
issue_d	The month which the loan was funded
loan_status	Current status of the loan. It can be fully paid or charged off or current
purpose	A category provided by the borrower for the loan request.
title	The loan title provided by the borrower
addr_state	The state provided by the borrower in the loan application
dti	A ratio calculated using the borrowers total monthly debt payments on the total debt obligations
revol_util	Revolving line utilization rate
pub_rec_bankruptcies	Number of public record bankruptcies
recoveries	post charge off gross recovery

Steps involved in Analysis

Importing the dataset

- The dataset is imported into pandas dataframe
- Total rows: 39717
- Total columns - 111
- Python Libraries used for analysis:
 - Pandas for data analysis and transformation
 - Seaborn, matplotlib, wordcloud, plotly for visualizations

Date Manipulation Before & After

BEFORE MANIPULATION OF NULL VALUES

AFTER MANIPULATION OF NULL VALUES

DETAILED DATA CLEANING EXPLAINED

Data Cleaning

Columns with all null values -54 columns

```

Columns with all same values -9 columns

```
[{"col": "id", "val": "same"}, {"col": "funded_amnt_inv", "val": "same"}, {"col": "grade", "val": "same"}, {"col": "home_ownership", "val": "same"}, {"col": "loan_status", "val": "same"}, {"col": "purpose", "val": "same"}, {"col": "dti", "val": "same"}, {"col": "mths_since_last_delinq", "val": "same"}, {"col": "revol_bal", "val": "same"}]
```

Columns with all distinct values -3 columns

```
[{"col": "id", "val": "distinct"}, {"col": "funded_amnt_inv", "val": "distinct"}, {"col": "grade", "val": "distinct"}]
```

Columns with > 80% null values -3 columns

```
[{"col": "id", "val": "80% null"}, {"col": "funded_amnt_inv", "val": "80% null"}, {"col": "grade", "val": "80% null"}]
```

Cleaning Data – based on data understanding

Customer behavior variables, After studying the data dictionary, further dropping customer behavior variables as it will not provide insights on defaulters

```
[{"col": "id", "val": "drop"}, {"col": "funded_amnt_inv", "val": "drop"}, {"col": "grade", "val": "drop"}, {"col": "home_ownership", "val": "drop"}, {"col": "loan_status", "val": "drop"}, {"col": "purpose", "val": "drop"}, {"col": "dti", "val": "drop"}, {"col": "mths_since_last_delinq", "val": "drop"}, {"col": "revol_bal", "val": "drop"}, {"col": "out_pmpop", "val": "drop"}, {"col": "total_rec_pmpop", "val": "drop"}, {"col": "collection_recovery_fee", "val": "drop"}, {"col": "last_credit_pull_d", "val": "drop"}, {"col": "application_type", "val": "drop"}, {"col": "acc_now_delinq", "val": "drop"}, {"col": "open_il_6m", "val": "drop"}, {"col": "total_bal_il", "val": "drop"}, {"col": "max_bal_bc", "val": "drop"}, {"col": "total_cu_tl", "val": "drop"}, {"col": "bc_open_to_buy", "val": "drop"}, {"col": "mo_sin_old_il_acct", "val": "drop"}, {"col": "mort_acc", "val": "drop"}, {"col": "ice_recent_revol_delinq", "val": "drop"}, {"col": "num_bc_sats", "val": "drop"}, {"col": "num_rev_accts", "val": "drop"}, {"col": "num_tl_30dpd", "val": "drop"}, {"col": "percent_bc_gt_75", "val": "drop"}, {"col": "total_bal_ex_mort", "val": "drop"}]
```

After analyzing description and zip code, since the number of distinct values are very high, it is better to drop these

```
[{"col": "id", "val": "drop"}, {"col": "funded_amnt_inv", "val": "drop"}, {"col": "grade", "val": "drop"}, {"col": "home_ownership", "val": "drop"}, {"col": "loan_status", "val": "drop"}, {"col": "purpose", "val": "drop"}, {"col": "dti", "val": "drop"}, {"col": "mths_since_last_delinq", "val": "drop"}, {"col": "revol_bal", "val": "drop"}, {"col": "out_pmpop", "val": "drop"}, {"col": "total_rec_pmpop", "val": "drop"}, {"col": "collection_recovery_fee", "val": "drop"}, {"col": "last_credit_pull_d", "val": "drop"}, {"col": "application_type", "val": "drop"}, {"col": "acc_now_delinq", "val": "drop"}, {"col": "open_il_6m", "val": "drop"}, {"col": "total_bal_il", "val": "drop"}, {"col": "max_bal_bc", "val": "drop"}, {"col": "total_cu_tl", "val": "drop"}, {"col": "bc_open_to_buy", "val": "drop"}, {"col": "mo_sin_old_il_acct", "val": "drop"}, {"col": "mort_acc", "val": "drop"}, {"col": "ice_recent_revol_delinq", "val": "drop"}, {"col": "num_bc_sats", "val": "drop"}, {"col": "num_rev_accts", "val": "drop"}, {"col": "num_tl_30dpd", "val": "drop"}, {"col": "percent_bc_gt_75", "val": "drop"}, {"col": "total_bal_ex_mort", "val": "drop"}, {"col": "zip_code", "val": "drop"}]
```

Treating null values

Column	Null value treatment
pub_rec_bankruptcies	Mode
emp_title	None
emp_length	0 (As numerical analysis is easier for this)

Heatmap after treating null values

Data Types Analysis, Data Formatting, Transformation

Feature name	Modified Feature name	Type of conversion	Explanation
int_rate	Int_rate	Object to float	Removal of % from data will make it float, easier for analysis
emp_length	emp_length_year	Object to int	Easier for bucketing
issue_d	Issue_d_month, issue_d_year	Extracted month and year	Easier for analysis on month, year
revol_util	revol_util_rate	Object to float	Removal of % from data will make it float, easier for analysis

Other features that are transformed to derived columns using bucketing logic during bivariate analysis- annual_inc, dti, loan_amnt, emp_title, installment, int_rate_bucket

Treating outliers

After analysis of all numerical columns, the following columns had outliers

Skewed annual income before treatment

Feature	Threshold (upper threshold)	% of data reduced	Explanation
loan_amnt	29250	3.1%	Some higher loan amounts, can create bias in the analysis.
annual_inc	139537.5	4.35%	People with very high income will create skewness in analysis.
installment	771	2.86%	Some installments may be very high, as people may have missed previous installments.

Data Integrity Checks and Summary

As per business understanding, `loan_amnt >= funded_amnt` and `funded_amnt >= funded_amnt_inv`. Performed test to check data integrity. All records are valid.

Summary: Total 35760 rows, 26 columns are remaining for analysis

```
Data columns (total 26 columns):
#   Column                               Non-Null Count  Dtype
---  -
0   loan_amnt                             35760 non-null  int64
1   funded_amnt                           35760 non-null  int64
2   funded_amnt_inv                       35760 non-null  float64
3   term                                  35760 non-null  object
4   int_rate                              35760 non-null  float64
5   installment                           35760 non-null  float64
6   grade                                  35760 non-null  object

15  purpose                               35760 non-null  object
16  title                                 35749 non-null  object
17  addr_state                            35760 non-null  object
18  dti                                    35760 non-null  float64
19  revol_util                             35712 non-null  object
20  recoveries                            35760 non-null  float64
21  pub_rec_bankruptcies                 34734 non-null  object
22  issue_d_year                          35760 non-null  object
23  emp_length_year                       35760 non-null  int64
24  revol_util_rate                       35712 non-null  float64
25  issue_d_month                         35760 non-null  object
```

Univariate Analysis

Loan status

Dropping rows with loan status- current, as it is not useful for our analysis

Grade

Most loan applicants have Grade, A, B

Issue Year

Most loan applicants applied in 2011

Employment length

Most loan applicants are either 10+, Freshers.

Verification_status

Most loan applicants have verification status as not Verified

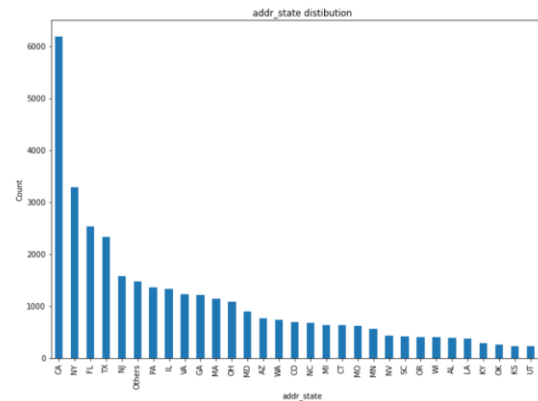

Univariate Analysis

Term

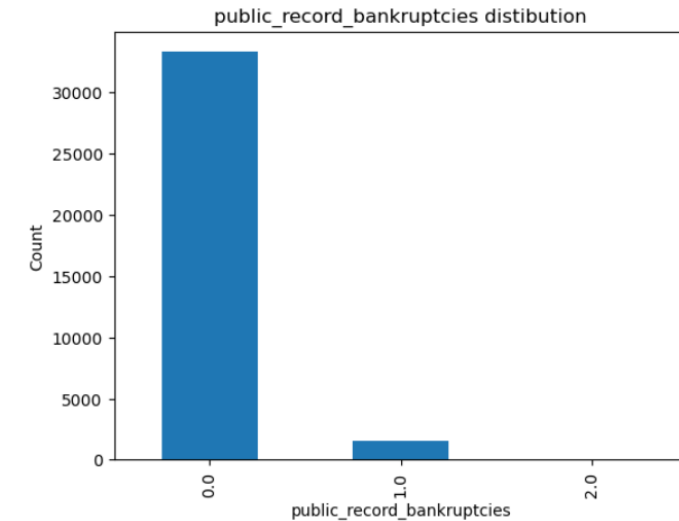

Address State

Most loan applicants are from CA

bankruptcies

Most loan applicants have zero bankruptcies

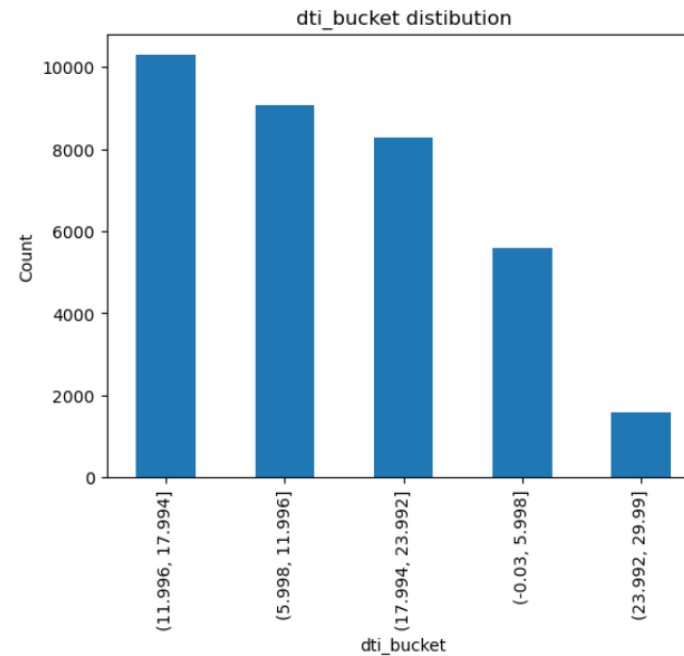

Word cloud on title shows debt consolidation as the highlight, since it is captured in purpose- dropping the column

Word cloud on title shows debt consolidation as the highlight, since it is captured in purpose- dropping the column

Univariate analysis

People are rounding off their loan amount to multiples of 1000s when applying for loan. Loan Amount has peaks at 5000, 10000, 15000, 20000, 25000s

Most applicants have dti bucket in the mod range

Interest rate has 3 peaks

Bi-Variate Analysis

Loan status(ratio) Vs Income Bucket:

Trends- As income increases, %of charged off decreases

Observation - Income <60k has a higher chance of charged off

Observation : Till 60k income , charged off is outlying the fully paid, after 60k fully paid is more occurring

Bi-Variate Analysis

Loan status Vs Term

Insights : chance of charged off is double when term is 60

Loan status Vs Purpose

Insights: If purpose=Small business, it has highest(27%) chance of charged off

Bi-Variate Analysis

Loan status(ratio) Vs Grade

Insights: As grade increases(A to B to C), % charged off increases

Loan status(ratio) Vs Subgrade

Insights: As subgrade increases, % charged off increases.

Also For F5 grade more charged off(50%) is observed

Bi-Variate Analysis

Loan Status(ratio) Vs Loan Amount:

Insight: Loan bucket 23K-30k have highest percentage of chargeoff

Trend- As loan amount increases, % charged off increases

Because of positive **correlation**, loan amount , funded amount, funded_amnt_inv, installment will follow similar trend

Bi-Variate Analysis

Loan status Vs Title

Observation: title Accenture has (0%) no charged off, while Walmart has highest Charged off

Observation: if employee title is null, higher chance of charged off

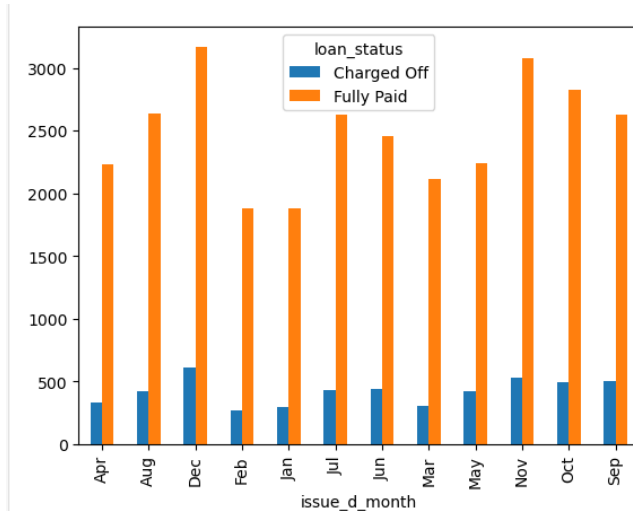

Since the data points for this conclusion is less, this cannot be a driver

Lending Club can tie up with Accenture for offers as there is a good success history

Bi-Variate Analysis

Loan Status(count) Vs Issue Month:

Trends- Most loan applicants were provided loan in Dec

Loan Status(ratio) Vs Issue Month:

Trends- Month is not conclusive for loan status

Bi-Variate Analysis

Loan Status(ratio) Vs Employment Length:

Observation - Employment length is not conclusive for any trend

Observation - If employment length is NA(plotted as 0) in graph, has higher(22%) chance of charged off as compared to others

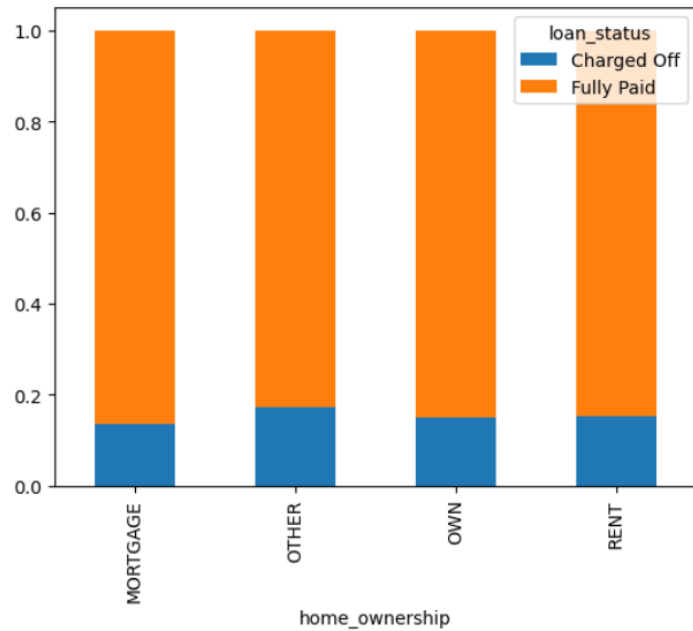

Loan status Vs Installment

Observation : It is not conclusive

As installment increases there is no obvious evidence of charged off increase

Bi-Variate Analysis

Loan status(ratio) Vs Home ownership

Observation: This is not conclusive as there is no trend seen

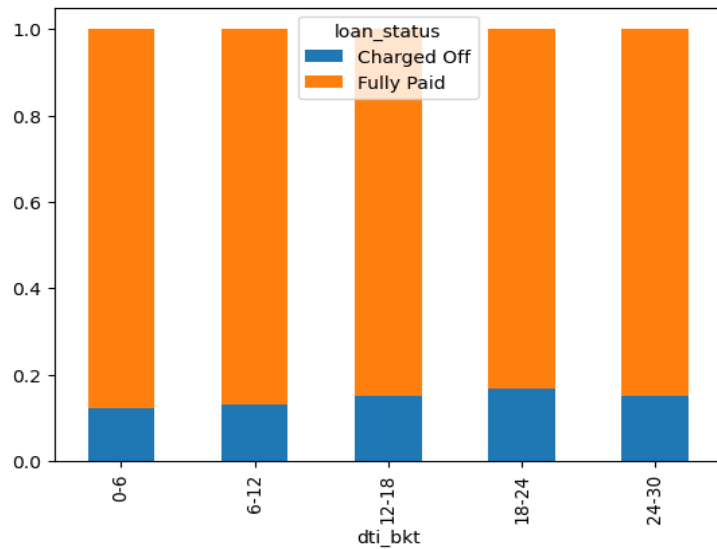

Loan status Vs Verification status

Observation: This is not conclusive as there is no trend seen

Bi-Variate Analysis

Loan status Vs Dti

Insights : dti is not showing a trend, 18-24% has comparatively higher chance of charged off

Loan status Vs Interest Rate

Insights : As interest increases, charged off increases

Bi-Variate Analysis

Loan status Vs addr state

Insights: For State : NV
proportion of charged off is more
when compared to rest all

Note: All locations with very few
data points(<200) are moved to
Others category. If this is not
done, state **NE** has most
charged off ratio

Bivariate Analysis - Charged Off

For observations on charged off dataset, we have segregated charged off from the original dataset. Below patterns are not drivers but key observations on Charged off dataset – against issued year, month, home_ownership

Multi Variate Analysis

Observation: If loan applicant falls in Grade G and lesser annual Income chance of default is high

Observation: When purpose is home improvement/major purpose/moving/small business and income is lower respectively then higher chance of charged of

Multi Variate Analysis

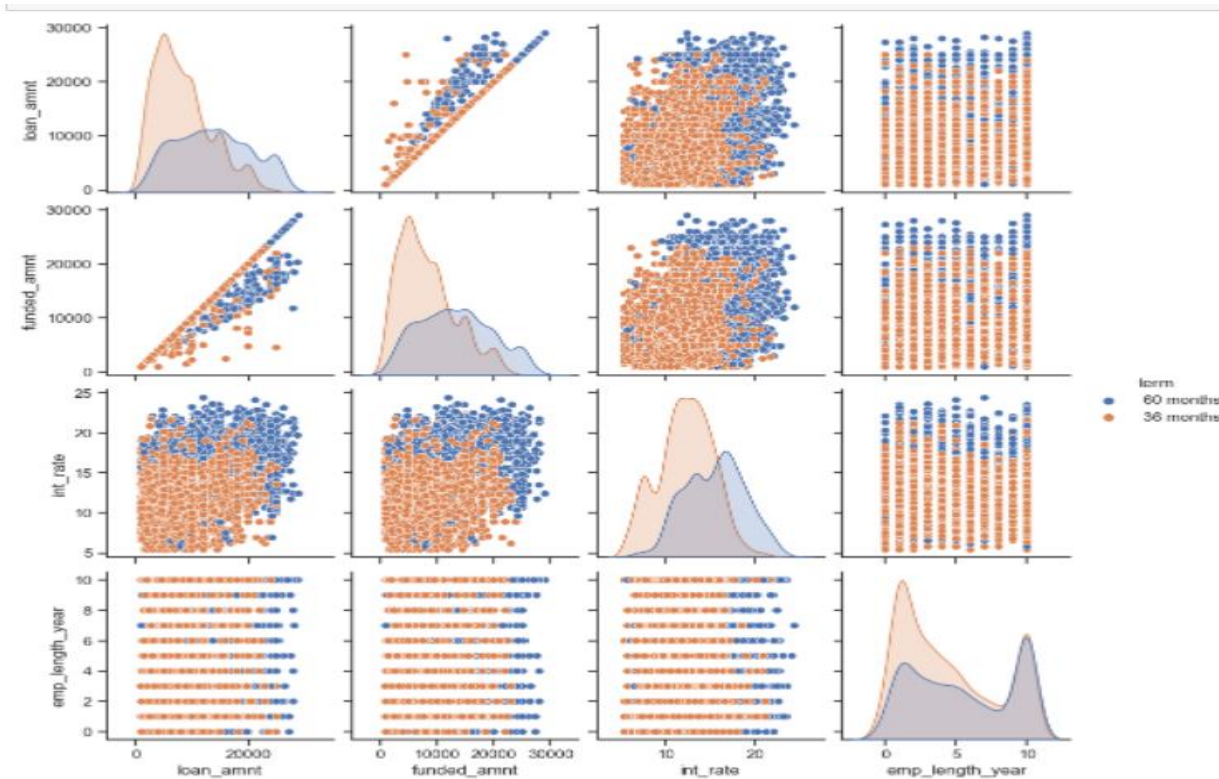

Multi Variate Analysis

Funded Amount Inv is higher if source is verified for all loan status (charged off and fully paid)

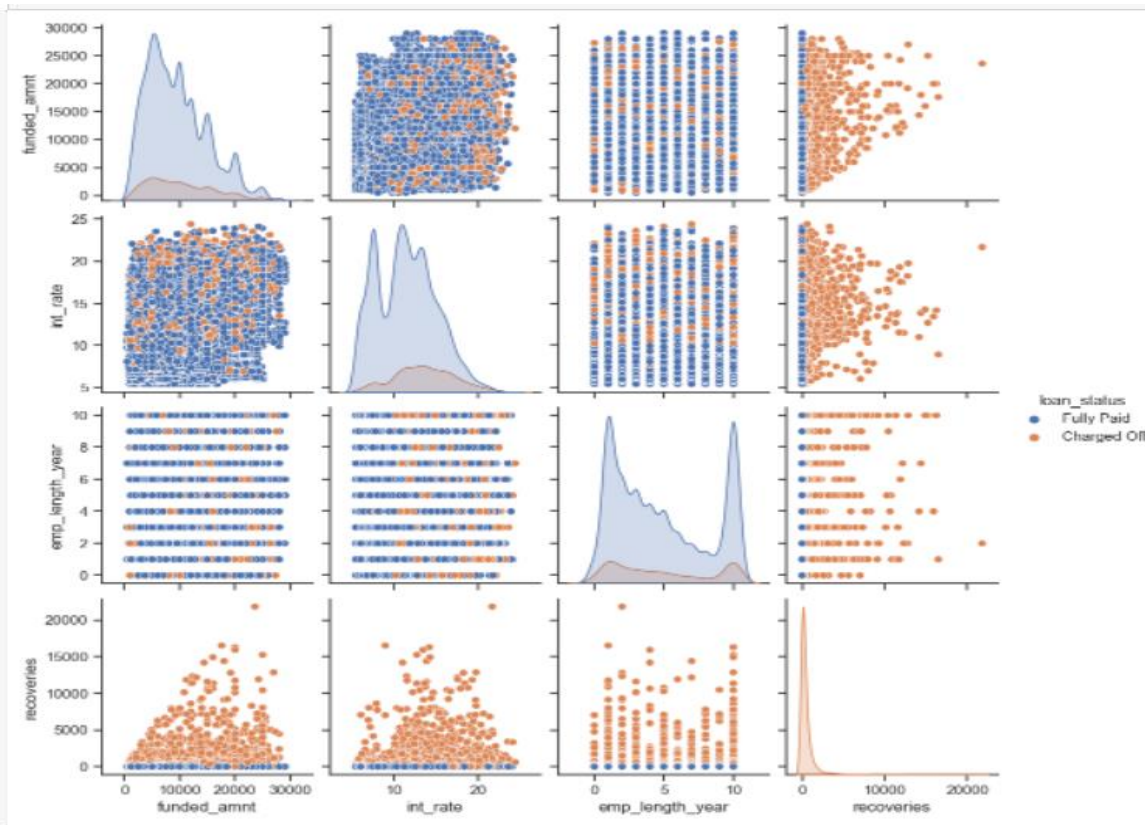

Multi-Variate Analysis (Pair Plot)

Conclusions from multivariate

1. Loan amount and funded amount is positively correlated
2. lower interest rate ≤ 18 & funded amount ≤ 20000 were using term 36 months.
3. Higher interest rate > 25 and funded amount upto 30000 were using loan term 60 months
4. Irrespective of emp_length, when funded amount > 20000 loan term used is 60 months
5. Irrespective of emp_length, when funded amount < 20000 term used is 36 months
6. if loan amount > 20000 , more 60 months term is observed, loan amount < 20000 36 months term is used
7. if funded amount > 20000 , more 60 months is observed, funded amount < 20000 36 months is applied
8. Across all emp length for lower int rate ≤ 18 , 36 months is used. for int rate above 18, 60 months is observed

Multi-Variate Analysis (Pair Plot)

Conclusions from multivariate

1. Across all emp length with lower int rate till 10 , more is fully paid, Across all emp length once when the int rate > 10 both fully paid and charged off is there
2. Between emp_length vs funded amount , no clean separation is observed
3. Between int_rate vs funded amount no clean separation observed between fully paid vs charged off
4. Between int_rate vs recovery , recoveries were zero for fully paid irrespective of int rate . recoveries were higher for charged off across all emp length (same applied for all recovery. Recoveries is closely associated to charged off . Not for fully paid)

Multi-Variate Analysis

Conclusions from heatmap

1. loan status towards fully paid is influenced by features like annual income , more higher the annual income more is fully paid
2. loan status towards charged off is influenced by features like
 - a, funded amount (Higher funded amount lower is fully paid(higher is charged off)
 - b. int_rate (Higher int rate lower is fully paid(higher is charged off),
 - c. dti (Higher dti lower is fully paid(higher is charged off),
 - d. pub rec bankruptcies, ((Higher pub rec bankruptcies lower is fully paid(higher is charged off)
 - f. revol_util_rate, emp title (Higher revol util rate lower is fully paid(higher is charged off)

Conclusion

Conclusion towards features driving loan defaulters:

1. **Loan Term**: chance of charged off is double when term is 60 months
2. **Purpose** is small business, higher chance of charged off
3. As **grade** increases (A to B to C and so on), higher chance of charged off . Within a grade as **Subgrade** increases (A1 to A5), higher chance of charged off. Chance of charged off is very high if subgrade is F5
4. **Interest rate** - As interest rate increases, % charged off increases
5. Public record **Bankruptcy** is a driver and as this increases, chance of charged off increases
6. **Annual Income**: As Income increases, charged off% decreases, specifically higher chance of charged off if Income less than 60 k
7. **Loan amount** : Higher loan amount increases chance of charge off
8. Emp title : when **emp title is not present**, they have higher chance of charged of

Analysis on multiple features

9. If loan applicant falls in **Grade G and lesser annual Income** chance of charged off is high
10. When **purpose is home improvement/major purpose/moving/small business and income is lower** then higher chance of charged of
